English: C1 (Advanced)

Work: B2B Contractor (Yerevan, GMT+4) · No visa sponsorship required

SUMMARY

Senior Backend Engineer with 9+ years of experience architecting high-load distributed systems, AI integration, and protocol reverse engineering. Deep expertise across the Node.js/TypeScript and Python ecosystem — microservices, event-driven architectures (Kafka), database optimization (PostgreSQL, ClickHouse), and cloud-native infrastructure (Kubernetes, AWS). Known for modernizing legacy systems, designing scalable services, and writing clean, testable code.

TECHNICAL SKILLS

Languages & Core:

- TypeScript, Node.js (NestJS), Python (FastAPI, Django), Go, SQL

Architecture & Patterns:

- Microservices, Event-Driven Architecture (EDA), REST, GraphQL, gRPC, RBAC

Data Storage & Streaming:

- PostgreSQL, ClickHouse, Elasticsearch, Redis, MongoDB, Kafka, RabbitMQ, WebSocket

Infrastructure & Tools:

- Docker, Kubernetes (K8S), AWS, CI/CD (GitLab CI, GitHub Actions), Linux, Jest, Prisma, TypeORM, Debezium, OpenCV

PROFESSIONAL EXPERIENCE

Dec 2025 — Present | Independent Contractor (Self-employed)

Senior Backend Developer / System Architect

- **AI-First Social Network:** Architected a global real-time video infrastructure (Jitsi Meet) with auto-scaling deployment pipelines, serving hundreds of thousands of MAU with ultra-low latency. Part of a ~5-person AI-native engineering team owning the full backend/infra stack.
- **FinTech:** Engineered an automated document recognition service (OpenCV) that streamlined KYC verification, deployed into the core internet banking backend. One of 4-6 senior fullstack engineers in a cross-functional team at a regional bank with a startup culture.
- **Digital Marketplace:** Scaled a Node.js/NestJS marketplace for software subscriptions and game sales. Eliminated data inconsistencies across microservices by implementing the Transactional Outbox pattern with Debezium CDC.

Aug 2024 — Dec 2025 | Video Platform & Services LLC

Senior Backend Developer / Acting Team Lead

- Architected a 180+ API monolithic application with optimized PostgreSQL schemas and complex JOIN queries, serving as the core platform backend.
- Designed a high-throughput S3 integration layer with multipart upload and resume support, enabling reliable large media file transfers.
- Decoupled document generation (PDF/Word) into a dedicated async worker service, eliminating timeout failures during peak traffic loads.
- Reduced CI pipeline duration by 2x-3x by implementing multi-threaded database testing in Jest.
- Served as Acting Team Lead for a 4-6 person backend division: managed task grooming and sprint prioritization, led code reviews, and authored the strategic design document for decomposing a 180+ API monolith into microservices.

Sep 2022 — Aug 2024 | CYBER-ROM

Backend Developer

- Built microservices for a video platform using NestJS and Go, with gRPC-based inter-service communication and Kafka event streaming.
- Implemented a full-text search engine on Elasticsearch with custom Russian morphology and weighted relevance scoring, measurably improving search result quality.
- Designed and built a greenfield backend from scratch — PostgreSQL, Redis, S3, and 2FA — as the foundation for a new service.

Jul 2021 — Jun 2022 | Hiplabs

Backend Developer

- Developed secure FinTech services (NestJS, PrismaORM) deployed on Kubernetes with automated CI/CD pipelines.
- Led the migration of a FoodTech platform to a multi-tenant architecture, isolating customer data while optimizing shared infrastructure.

Jun 2020 — Jun 2021 | Independent Contractor (Self-employed)

Backend Developer

- **Algo-trading:** Built ETL pipelines (Python) processing financial market data into a high-performance ClickHouse storage layer optimized for analytical queries.
- **B2B Energy Platform:** Developed a real-time messaging platform (Node.js, WebSocket) with KeyCloak SSO for enterprise identity management.
- **Highload Messaging:** Built a high-throughput REST API (Go) for mass mailing campaigns, handling millions of deliveries reliably.

Feb 2016 — May 2020 | JetStyle

Backend Developer

- Built the server-side of a predictive analytics pipeline — real-time telemetry ingestion (SocketIO) → Node.js processing → ClickHouse time-series storage.
- Reverse-engineered undocumented government SOAP protocols (MITM, JADX) to integrate legacy services into the platform.

EDUCATION

Master's Degree in Mobile Communications, Ural Federal University (UrFU), IRIT-RTF, 2014–2016.

Specializing in cellular network architecture, broadband communications and mesh networking.

Bachelor's Degree in Mobile Communications, Ural Federal University (UrFU), IRIT-RTF, 2010–2014.

Specializing in RF band analysis, low-level systems programming and network layer models (OSI).
